Geotope 16. Nölbling Waterfall – The Remote One

Red marking: Hiking route according to advance description; green tracks: hiking trails; ©BEV: Federal Office for Calibration and Measurement, 2005.

Access:

In the small village of Unternölbling a road has to be followed in southern direction until the bridge over the Nölbling Creek. Some 100 m south of the bridge the waterfall is exposed.

Description of the Geotope

The waterfall can be reached within a few minutes from the bridge at the beginning of the Nöbling Creek. The water rushes over several rock steps composed of dolomitic rocks with shales and sandstones of the Hochwipfel Formation above. The waterfall is a distinct example for churning and thunderous water which generates a kind of white foam and spray of fine water droplets in the surrounding.

The Nöbling Waterfall during snow melting in spring-time.
